

A Fish Factory in Portugal

The Problem

At a fish factory in Portugal it was necessary to soak cod for three days in order to clean it. Due to heavy sediment contamination of the water the cod fish used to stay brown. In addition the fish washing machine needed to be descaled every 15 days because of scale build up on the element.

The Solution

A Fluid Dynamics Fast Flow sediment filter and two 1" Scaletrons were fitted to the fish washing machine. The effects were dramatic, cutting the soaking time for cod from three days to one day and the cod now stay white and suffer no discoloration. In addition the heating elements now need descaling only once every two months, instead of every 15 days. Needless to say the client is very happy.
